S1
A Powerful ETF Rotation Investment Strategy (45)

S2

To invest in an ETF portfolio:

- *Elaborate the list of the 20 ETFs representing the 20 most important industries of the us market*
- *Keep these 20 industries in the crosshairs, monitoring the performance of the ETFS that represent those sectors*
- *Every 15 days we invest only in the ETF that is having the best quarterly performance among the 20*

It would avoid the following problems:

- *When one invests in the sector to which a company belongs instead of investing in the individual company, one profits from the price rally of the sector without getting exposed to the particular risks of that individual company.*
- *In other words, by concentrating the full firepower (investment capital) in the industry with the largest quarterly returns, we avoid wasting our capital by in assets whose price is going down,*
- This is not only a good way to invest in stock indexes, but it can be done also with a list of ETFs representing the 7 kinds of US government bonds considered according to their maturity.

S3
Summary of the philosophy behind this methodology

- When one considers investing in blue-chips (LARGE COMPANIES) of certain sectors of the industry, one is just trying to invest not in the companies themselves, but in those SECTORS of the industry they belong to.

S4
Summary of the philosophy behind this methodology

- On the other hand, when one considers investing in small capitalization companies of a certain industry, one is just trying to invest in THOSE PARTICULAR companies that have growing potential within that industry.

S5
Summary of the philosophy behind this methodology

- To avoid that dilemma between representativity and growing potential, and in order to have the "best of both worlds", it's much better to invest in the ETF that represents that industry (Buying the ETF is practically buying "an index" that contains all the stocks, large and small, belonging to a certain industrial sector).

S6
Summary of the philosophy behind this methodology

- In that way, one includes both the blue-chips (large companies) and the “small caps” (smaller companies) besides all the other stocks of that industry, in a single investment.

S7
Summary of Investment Procedure

- Let us assume that today is December 1, 2015
- **STEP I:** search in yahoo finance the 20 ETFs representing the 20 industrial sectors of the US market
- **STEP II:** search in yahoo finance the 7 ETFs representing the 7 types of US Bonds (very short term, short term, short-mid-term, mid-term, mid-long term, long term, ultra long term)
- **STEP III:** make a list in excel of the 20 ETFs representing the industrial sectors and write next to each one its price percent change in the last 3 months

- ***Example: [Gold percent change between September 1 and December 1] = [gold percentage change on December 1, 2015] minus [gold percentage change on September 1, 2015] divided by [gold percentage change on December 1, 2015]***

S8
Summary of Investment Procedure

- **STEP IV:** do the same for the 7 bond e ETFS
- **STEP V:** chose the Stock ETF with the highest percent change among the 20 ETFS representing the us economy sectors,
- **STEP VI:** do the same for the Bond ETF
- **STEP VII:** invest the capital available as follows, according to your risk profile:
- *70% stocks & 30% bonds (aggressive portfolio)*
- *60% stocks & 40% bonds (balanced portfolio)*
- *50% stocks & 50% bonds (risk-neutral portfolio)*
- *40% stocks & 60% bonds (conservative portfolio)*
- *30% stocks & 70% bonds (risk-averse portfolio)*
- **STEP VIII:** wait 15 days invested in the market
- **STEP IX:** close the previous positions, repeat the selection process and reinvest all your capital in the newly selected Stock ETF and Bond ETF.

S9
Objectives

- To understand one of the latest and most effective market principles used by portfolio managers today (market momentum)
- To simplify the use of market momentum in order to make it accessible to the layman, attempting to preserve, as far as possible, the high returns and low volatility these strategies are able to generate.

S10
Introduction

- There is an anecdote attributed to Keynes, according to which, instead of trying to predict the market cycles in order to buy bonds with good timing, he used to wait until the bonds started to go up, and only then would he buy them…

S11
Introduction

- …which is exactly what the managers of many hedge funds do today, calling the technique "rotational momentum", a modality of which essentially consists of investing only in those asset classes whose average return in the last three months is higher than the returns in the same period of all the other assets in its class. In fact, this idea is the basis of our actual system, and let me explain why such a simple principle works well in real life.

S12
Introduction

- When we invest only in those asset classes whose average return in the last three months is higher than the returns in the same period of all the other assets in its class, we are just comparing the “relative momentum” of the different assets so that we can invest in the one with the highest momentum.

S13
Introduction

- As in physics, where Newton's laws imply that moving objects tend to keep moving, it has been observed by many, that most trending asset prices tend to keep going up for a while before dwindling and changing direction.

S14
Introduction

- The whole purpose of the present work is to show that this assumption is true when tested on a particular set of market assets.

S15
Introduction (cont.)

How is the system structured?

- Every 15 days, we will select the one ETF that has the larger quarterly momentum, from a list of 20 ETFs representing the 20 relevant industrial sectors of the us economy.

S16
Introduction (cont.)

How is the system structured?

- Essentially, the ETF selected will be the one with the best performance (highest percentage change) in the last 3 months.

S17
Introduction (cont.)

How is the system structured?

- (This idea, called Active Asset Allocation (AAA) reminds that of an honor roll in which only the best student --the one who received the highest mark in the last quarter--, makes it to a “single person’s head list”.

S18
Introduction (cont.)

How is the system structured?

- This methodology, called “relative strength selection”, is similar in many aspects to the one used by the managers of the Yale University Endowment Fund, and other Ivy League Schools, as stated in Mebane Faber’s book “The Ivy Portfolio”

S19
Introduction (cont.)

How is the system structured?

- According to the described methodology, we will select every 15 days the ETF (Exchange Traded Funds: concept explained in the Appendix), that had the greatest returns during the last three months among the 20 sectors in the list, though providing the investor with thorough exposure to that particular sector of the capital markets)

S20
Introduction (cont.)

- To underline the relevance of this way of trading, which is taking over, in its different modalities, the modern way of managing portfolio management, I quote a white paper referring to the advantages of Adaptive Asset Allocation:

- *"…Adaptive Asset Allocation is robust to changes in market character because its proper application uses a variety of standard parameter look-backs for estimation. Further, volatility and correlation management, as well as more regular rebalance frequency, provides substantial tailwinds for portfolios. Lastly, AAA portfolios are always optimally diversified, which makes them robust to market shocks which wreak havoc on more concentrated tactical portfolios. The portfolio management industry is undergoing a revolution analogous to the shift that occurred after Markowitz introduced his Modern Portfolio Theory in 1967. Managers who embrace the new methods will increasingly dominate traditional managers; those who fail to adapt will, inevitably, face extinction…"*

S21
What is an ETF?

- An ETF is an open mutual fund, in other words, like a “club” whose assets are not buildings but stocks of different companies. Like any club, if its property (Stocks) are doing well, the club itself will prosper, and vice-versa… The shares of this “club” can be purchased or sold by any “member” as if it was itself any regular stock of a company.

S22
What is an ETF?

- Differently from a traditional mutual fund, which can only be bought or sold at the end of the day at a certain price determined by its NAV (net patrimony) and directly from the original seller, an ETF can be bought or sold at any point throughout the day in the stock market at a price dictated by the ever-changing market.

S23
What is an ETF?

- ETFs first got investors' attention as super-efficient investment vehicles to passively gain access to extensive administrative indices such as the SP500 and the MSCIEAFE.

S24
What is an ETF?

- Through time, ETFs have evolved to become a way for investors to focus with extreme precision on subsectors of industry, raw materials and fixed rent.

S25

Main Industrial Sectors Of The Stock Market:

- Software industry
- Heavy industry
- Internet industry
- Semiconductors industry
- Media industry
- Bank industry
- General tech industry
- Insurance industry
- Aerospace defense industry
- Medical devices industry
- Home construction industry
- Transportation industry
- Materials industry
- Telecomm industry
- Capital markets industry
- Consumers staple (daily use products) industry
- Real estate industry
- Pharmaceuticals industry
- Food & beverages industry
- Biotechnology industry
- Utilities industry
- Oil and gas industry
- Retail stores industry

S26

ETFs that Represent These Sectors:

Symbol	ETF
IGV	iShares S&P Software Industry Index
IYJ	iShares DJ U.S. Industrials Sector
FDN	First Trust DJ Internet Index
SMH	Market Vectors Semiconductor ETF
PBS	PowerShares Intelliedex Dynamic Media
KBE	SPDR S&P Bank Industry Index
IYW	iShares DJ U.S. Technology Sector
KIE	SPDR S&P Insurance
ITA	iShares Dow Jones U.S. Aerospace-Defense
IHI	iShares DJ U.S. Medical Devices
ITB	iShares DJ Home Construction Index
IYT	iShares Dow Jones Transports
XLB	U.S. Materials Sector SPDR
IYZ	iShares Dow Jones Telecomm
KCE	SPDR S&P Capital Markets
XLP	U.S. Consumer Staples Sector SPDR
VNQ	Vanguard MSCI U.S. REIT
IHE	iShares DJ U.S. Pharmaceuticals
PBJ	PowerShares Intellidex Food & Beverage
IBB	iShares Nasdaq Biotechnology Index
IEZ	iShares DJ U.S. Oil Equipment & Services
XLU	U.S. Utilities Sector SPDR
XOP	SPDR S&P Oil & Gas E&P
XRT	SPDR S&P U.S. Retail Industry
IHF	iShares DJ U.S. Healthcare Providers

S27

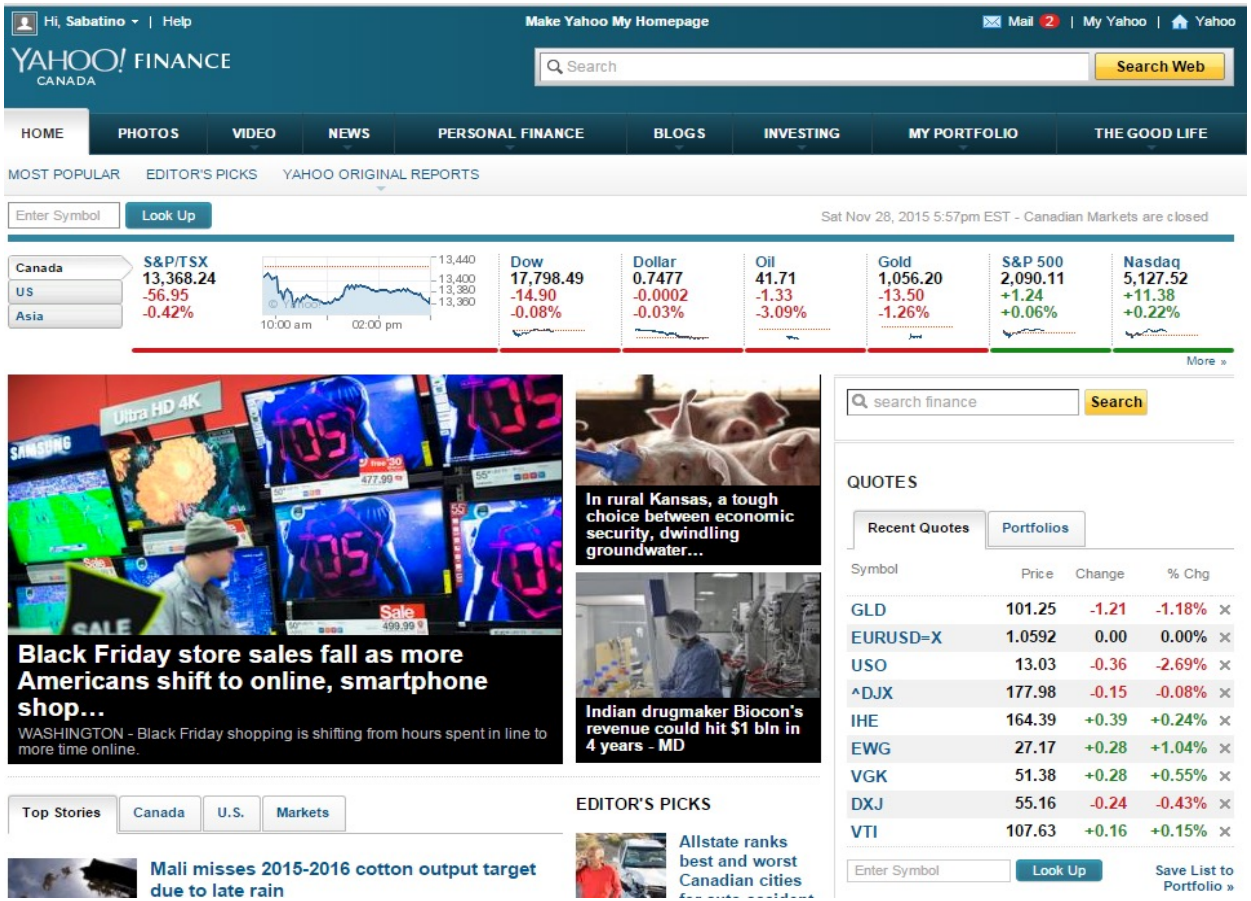
Copy symbols for each ETF in an excel spreadsheet:

- Call this one your “master list”.
- Hold on to this list because it will be your guideline for re-investing your money every 15 days (mid and end of each month)
- For example, suppose that today is the end of the month and you want to invest in the market:

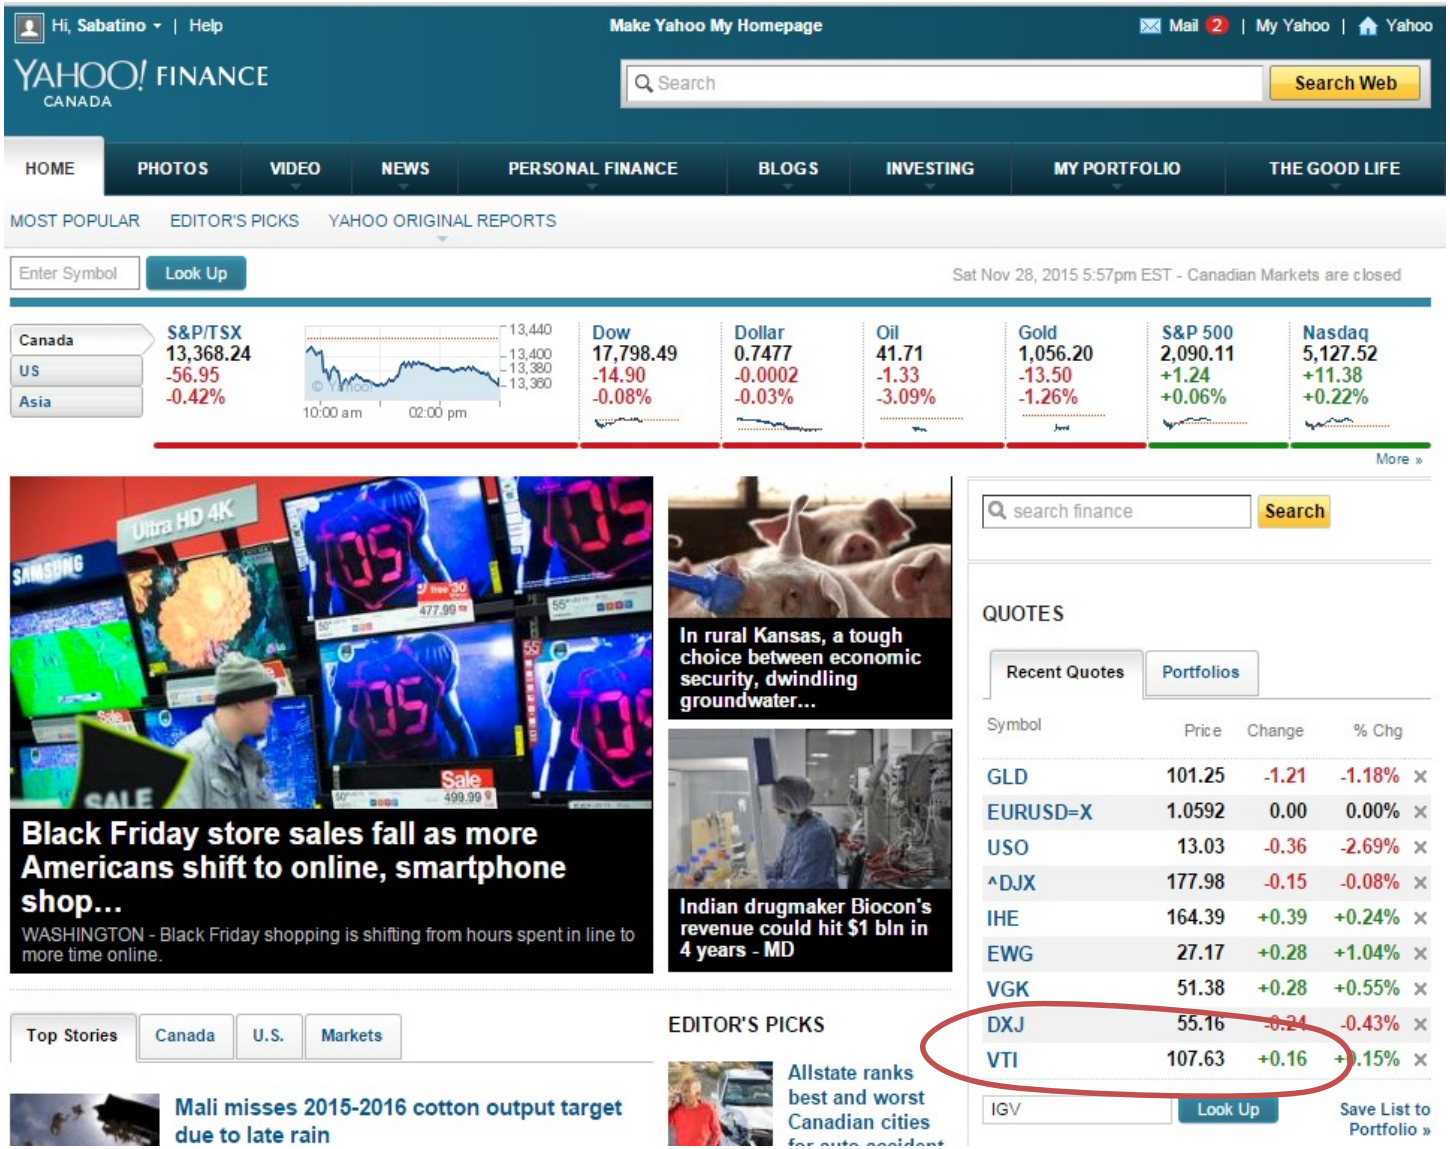
ETF SYMBOL
IGV
IYJ
FDN
SMH
PBS
KBE
IYW
KIE
ITA
IHI
ITB
IYT
IYZ
KCE
VNQ
IHE
PBJ
IBB
IEZ
IHF

S28 Steps to use the Investment Strategy

1. Go to the "Master List"
2. Look at first ETF there (IGV)
3. Find "IGV" in Yahoo Finance (https://ca.finance.yahoo.com/)



S29 Step 4: Write the symbol "IGV" in *lower* search box:



S30 Step 5: hit “look up” and get to the IGV page:

TSX ↓0.42% TSX Ventures ↑0.05%

Fund Summary

The investment seeks to track the investment results of an index composed of North American equities in the software sector. The fund generally invests at least 90% of its assets in securities of the underlying index and in depositary receipts representing securities of the underlying index. The underlying index measures the performance of U.S.-traded stocks of software-related companies in the United States and Canada. The fund is non-diversified. View More

S31 Step 6: open the 3 months chart by clicking on “3m” under the chart:

The 3m chart gives you right away today’s (Nov. 27) price for IGV: $ 105.81

S32 Step 7: we still need to get IGV's price three months ago. for that, move the cursor to the left of the chart and read the date and price in the upper left corner of the chart:

"Aug 28, 2015: IGV = 96.28"

S33 Step 8: subtract Aug price from today's price and divide the result by Aug price to get the percent change of IGV's price in the last 3 months: (105.81 – 96.28) / 96.28 = 0.099 which is essentially a percentage change of +10%

S34 Step 9: repeat this procedure for the other ETFs in the list and write the corresponding percentage changes next to each one of them:

ETF SYMBOL	RETURN (%)
IGV	10
IYJ	7.1
FDN	10.7
SMH	10.7
PBS	8.6
KBE	8.5
IYW	8.9
KIE	6.2
ITA	5.6
IHI	2.8
ITB	4.6
IYT	4.3
IYZ	4.4
KCE	3.6
VNQ	6.6
IHE	2.8
PBJ	4.5
IBB	3.5
IEZ	0.9
IHF	7

S35 Step 10: add a "score" column to your master list and fill it applying the excel "rank function" to "rank" the ETFs according to their returns, <u>assigning the highest scores to the highest returns</u> (i.e., write 0 at the end of the rank function)

RANK Function Basics

If you give the RANK function a number, and a list of numbers, it will tell you the rank of that number in the list, either in ascending or descending order.

For example, in the screen shot below, there is a list of 10 student test scores, in cells B2:B11.

To find the rank of the the first student's score in cell B2, enter this formula in cell C2:

=RANK(B2,$B$2:$B$11)

	A	B	C	D	E
1	Student	Scores	Rank		
2	Al	46	=RANK(B2,$B$2:$B$11)		
3	Ben	31	RANK(number, ref, [order])		
4	Cam	39			
5	Dee	32			
6	Ed	36			
7	Flo	20			
8	Gil	45			
9	Hal	23			
10	Ivy	38			
11	Joe	38			
12					

Then, copy the formula from cell C2 down to cell C11, and the scores will be ranked in descending order.

	A	B	C	D
1	Student	Scores	Rank	
2	Al	46	1	
3	Ben	31	8	
4	Cam	39	3	
5	Dee	32	7	
6	Ed	36	6	
7	Flo	20	10	
8	Gil	45	2	
9	Hal	23	9	
10	Ivy	38	4	
11	Joe	38	4	
12				

S36 Applying it to the list you get the following:

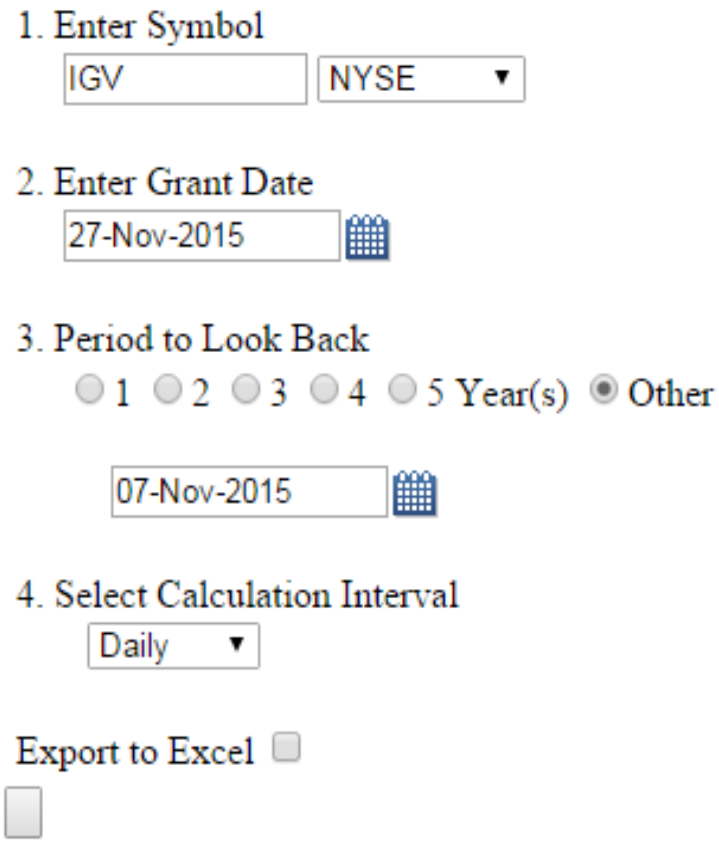
ETF SYMBOL	RETURN (%)	SCORE RET
IGV	10	18
IYJ	7.1	14
FDN	10.7	19
SMH	10.7	19
PBS	8.6	16
KBE	8.5	15
IYW	8.9	17
KIE	6.2	11
ITA	5.6	10
IHI	2.8	2
ITB	4.6	9
IYT	4.3	6
IYZ	4.4	7
KCE	3.6	5
VNQ	6.6	12
IHE	2.8	2
PBJ	4.5	8
IBB	3.5	4
IEZ	0.9	1
IHF	7	13

You will buy (and keep for the next 15 days) the ETF with the highest score (percentage change) in the list (in this case FDN or SMH, with 10.7%).

- 15 days from now you will repeat the procedure again, sell what you bought and buy the ETF that rose to the top of the list by then, keeping it for 15 more days, and so forth.

S37 If you want to make the system less volatile, add the following steps:

11. Calculate the 1m volatility of each ETF in the list by using: https://www.stockvantage.com/solium/servlet/volatilitycalculator.do



Example:

In the case of "IGV", fill 'IGV' and 'NYSE'(New York Stock Exchange) in "enter symbol", and fill '07-nov-2015' in "period to look back" (this is 20 days ago = one trading month ago).
Finally, select "daily" in "calculation interval" and hit the key located below "export to excel" to obtain IGV's volatility: 12.6%

S38 12. Repeat the procedure for all ETFs and add a column with the respective volatilities of all the ETFs, to the previous list:

ETF SYMBOL	RETURN (%)	SCORE RET	VOLATILITY (%)
IGV	10	18	12.6
IYJ	7.1	14	11.5
FDN	10.7	19	15.8
SMH	10.7	19	18.3
PBS	8.6	16	12
KBE	8.5	15	18.5
IYW	8.9	17	14.5
KIE	6.2	11	13.4
ITA	5.6	10	13.9
IHI	2.8	2	13.6
ITB	4.6	9	19.2
IYT	4.3	6	12.6
IYZ	4.4	7	12.4
KCE	3.6	5	18.7
VNQ	6.6	12	19.1
IHE	2.8	2	19.1
PBJ	4.5	8	16.1
IBB	3.5	4	23.6
IEZ	0.9	1	33.7
IHF	7	13	23.8

S39 13. Add a "score" column to this list and now "rank" volatility, but this time, --since volatility is "bad"--, <u>assigning the highest score to the lowest volatility</u> (i.e., write 1 in the end of the rank function)

ETF SYMBOL	RETURN (%)	SCORE RET	VOLATILITY (%)	SCORE VOL
IGV	10	18	12.6	16
IYJ	7.1	14	11.5	20
FDN	10.7	19	15.8	11
SMH	10.7	19	18.3	9
PBS	8.6	16	12	19
KBE	8.5	15	18.5	8
IYW	8.9	17	14.5	12
KIE	6.2	11	13.4	15
ITA	5.6	10	13.9	13
IHI	2.8	2	13.6	14
ITB	4.6	9	19.2	4
IYT	4.3	6	12.6	16
IYZ	4.4	7	12.4	18
KCE	3.6	5	18.7	7
VNQ	6.6	12	19.1	5
IHE	2.8	2	19.1	5
PBJ	4.5	8	16.1	10
IBB	3.5	4	23.6	3
IEZ	0.9	1	33.7	1
IHF	7	13	23.8	2

S40 14. Now, finally, all you have to do is to add the 2 scores to get a global score for each ETF:

ETF SYMBOL	RETURN (%)	SCORE RET	VOLATILITY (%)	SCORE VOL	GLOBAL SCORE
IGV	10	18	12.6	16	34
IYJ	7.1	14	11.5	20	34
FDN	10.7	19	15.8	11	30
SMH	10.7	19	18.3	9	28
PBS	8.6	16	12	19	35
KBE	8.5	15	18.5	8	23
IYW	8.9	17	14.5	12	29
KIE	6.2	11	13.4	15	26
ITA	5.6	10	13.9	13	23
IHI	2.8	2	13.6	14	16
ITB	4.6	9	19.2	4	13
IYT	4.3	6	12.6	16	22
IYZ	4.4	7	12.4	18	25
KCE	3.6	5	18.7	7	12
VNQ	6.6	12	19.1	5	17
IHE	2.8	2	19.1	5	7
PBJ	4.5	8	16.1	10	18
IBB	3.5	4	23.6	3	7
IEZ	0.9	1	33.7	1	2
IHF	7	13	23.8	2	15

- Now, you should invest in the ETF with the highest total score (it means it has the highest return and the lowest volatility), and hold it for 15 days, until you repeat the procedure, sell the ETF you have and buy the new ETF with the highest score

S41 …If you want to reduce volatility even further…

Add to the list in step 9 an extra column with the ETFs corresponding percentage changes in the last month (for this, just follow exactly the same procedure as for step 10. in the case of IGV, the monthly return was 2.1%)

Symbol	ETF	ReturnA	ReturnB
IGV	iShares S&P Software Industry Index	+10.0%	+2.1%
IYJ	iShares DJ U.S. Industrials Sector	+7.1%	+2.0%
FDN	First Trust DJ Internet Index	+10.7%	+3.2%
SMH	Market Vectors Semiconductor ETF	+10.7%	+2.3%
PBS	PowerShares Intelliedex Dynamic Media	+8.6%	-0.6%
KBE	SPDR S&P Bank Industry Index	+8.5%	+3.6%
IYW	iShares DJ U.S. Technology Sector	+8.9%	+0.2%
KIE	SPDR S&P Insurance	+6.2%	+0.3%
ITA	iShares Dow Jones U.S. Aerospace-Defense	+5.6%	+1.5%
IHI	iShares DJ U.S. Medical Devices	+2.8%	+3.7%
ITB	iShares DJ Home Construction Index	+4.6%	+7.0%
IYT	iShares Dow Jones Transports	+4.3%	+1.2%
XLB	U.S. Materials Sector SPDR	+5.2%	+0.9%
IYZ	iShares Dow Jones Telecomm	+4.4%	+0.1%
KCE	SPDR S&P Capital Markets	+3.6%	+4.6%
XLP	U.S. Consumer Staples Sector SPDR	+5.6%	-1.0%
VNQ	Vanguard MSCI U.S. REIT	+6.6%	-0.8%
IHE	iShares DJ U.S. Pharmaceuticals	-2.8%	+4.2%
PBJ	PowerShares Intellidex Food & Beverage	+4.5%	-1.6%
IBB	iShares Nasdaq Biotechnology Index	-3.5%	+3.8%
IEZ	iShares DJ U.S. Oil Equipment & Services	-0.9%	+2.0%
XLU	U.S. Utilities Sector SPDR	+0.0%	-1.8%
XOP	SPDR S&P Oil & Gas E&P	+0.0%	+1.0%
XRT	SPDR S&P U.S. Retail Industry	-2.6%	-0.2%
IHF	iShares DJ U.S. Healthcare Providers	-7.0%	-0.5%

- **Rank this new column as you did with 3m returns.**
- **The exact same procedure (steps 1 to 14) is applied to govt. bonds**

S42

- Let's now combine the idea to pick "the best Stock ETF out of 20" described above with "the best Bond ETF out of 7"; i.e., the same idea, but now applied to a list of 7 ETFs representing the 7 kinds of government bonds classified according to the 7 different maturities. Depending on the risk profile of the client, the combination could be one of the following:

- *70% Stocks & 30% Bonds (Aggressive Portfolio)*
- *60% Stocks & 40% Bonds (Balanced Portfolio)*
- *50% Stocks & 50% Bonds (Risk-Neutral Portfolio)*
- *40% Stocks & 60% Bonds (Conservative Portfolio)*
- *30% Stocks & 70% Bonds (Risk-Averse Portfolio)*

- You'll find uploaded in Quercus, among many other resources, a few versions of a trading program that back-tests our "Rotational Momentum Protocol". One of these versions has a built-in "Trailing Stop Loss" whose structure is commented within the program itself.

Notice:

- We also include in this material, for completeness sake, a version of such a program without the Trailing Stop --, which is to be used by professionals who understand that:
- (i) during low inflation times (<2.5%), Stocks and Bonds rarely move together, and therefore, given the structure of the program, NO stop-loss is needed,
- (ii) nevertheless, during high inflation times (>2.5%), Stocks & Bonds become highly correlated and therefore a Trailing Stop has to be included in case they fall, like now.
- Obviously the program WITHOUT the stop-loss will be less often out of the market (less false positives) than the "safer" (slower, more complex) one, and therefore will perform better in low-inflationary periods, but a discretionary stop-loss (it could be the one described above) should be used when inflation (and corr. of Stocks & Bonds) moves above 2.5%.
